Spotify clone:

After creating the react app, I would create a structured project directory, having a folder labeled components that contain the homepage, search bar, play music option, and the users profile page. Using the router feature in react to navigate between these components. For fetching the and managing the music I would use Spotify's web API, which gives access to their music and user data. Including authentication for users, styling using CSS, and running tests to ensure the application runs smoothly.

Pinterest Clone:

Creating a Pinterest clone would be relatively similar to the Spotify clone, I would need to include a home page, profile page, save page, and a page that allows posts to be saved to named groups created by the user.
